CSE 102L Computer Programming Laboratory – Homework08

Due Date: 23:59 Sunday May 26th

Disclosure

You will submit your file to an assignment that is given through MS teams. Your filename should be <code>HW08_yourStudentNumber.java</code>. Submissions made after the deadline will not be accepted, be sure to submit your work before the due date and make sure to click turn in button. Your code will be automatically controlled, so be sure to have the same class, method, variable names as described here. Failure to do so may result in you receiving 0 from this exercise. All classes should be written to a single Java file. In a single java file there can only be single public class. Do NOT use Inner Classes. Be careful naming your file. If your editor inserts the file into a package, remove that line from the file but do NOT delete the import statements.

Write set of classes according to the following specifications. Declare all attributes as **private** if not requested otherwise and use camelCase formatting for attributes.

Classes

- 1. User
- Attributes:

o id: int

username: Stringemail: String

followers: set of Usersfollowing: set of UserslikedPosts: set of Posts

o messages: a map from User to Queue of Messages

Methods:

- Constructor that takes username and email. Initializes attributes. Uses itself's hashCode() method to initialize id field.
- Accessors and Mutators for username and email
- Accessors for followers, following, and likedPosts
- message(recipient: User, content: String): None if the messages field doesn't contain recipient as key, puts an empty list with recipient as key. Repeats this process for recipient instance (pay attention to keys). Initialize a new Message instance with this and content. Add this Message instance to queue of recipient and this. Call read(recipient) method.
- o read(user: User): None Displays all the messages from user.
- follow(user: User): None this method has multiple use case. Firstly, it follows the given user. Secondly, if its already following the user, unfollows user.
 (Don't forget to add or remove from corresponding sets)

- like(post: Post): None like follow method, likes the given post. If already liked, unlike. Calls the likedBy() method of post
- o post(content: String): Post Initializes a new Post with *content* and returns it
- o comment(post: Post, content: String): Comment Initializes a new Comment with *content* and returns it after calling **commentBy()** method of *post*.
- Overrides equals method using the ids of this and given object.
- Overrides hashCode method with using **Objects** class' **hash** method. Uses only
 email attribute to hash the object.

2. Message

• Attributes:

o seen: boolean

o dateSent: java.util.Date

content: Stringsender: User

Methods:

- Constructor that takes sender and content. Initializes dateSent with current time and seen with false.
- o read(**reader**: User): String if *sender* is **not** *reader*, sets seen as true. Displays a message "Sent at: " + dateSent, returns content
- hasRead(): boolean

3. Post

Attributes:

datePosted: java.util.Date

content: Stringlikes: set of Users

o comments: a map from User to List of Comments

Methods:

- Constructor that takes content. Initializes datePosted with current time and initializes other attributes.
- o likedBy(user: User): boolean **adds** the user to likes. If cannot add, removes *user* from likes. Returns the result of adding operation.
- commentBy(user: User, comment: Comment): boolean puts the given comment to user's list of comments.
- getContent(): String Displays a message "Posted at: " + datePosted, and returns the content
- getComment(user: User, index: int): Comment gets the comment from comments if user has any comments on post and if index doesn't exceed user's size of comments. Otherwise returns null
- getCommentCount(): int returns the total number of comments. (be careful)
- getCommentCountByUser(user: User): int returns the total number of comments for given user. (be careful)

4. Comment – child class of Post

- 5. SocialNetwork
- Attributes:
 - o postsByUsers: a **static** map from Users to list of posts
- Methods:
 - o register(username: String, email: String): User instantiates a user object with given parameters and if *postsByUsers* doesn't have instantiated object, puts an empty list with user key and returns user. If the same user exists in map, returns null
 - o post(user: User, content: String): Post if given *user* is registered instantiates a new post with given content and adds to list in *postsByUsers* with user as key.
 - getUser(email: String): User uses hash() method of Objectst to hash the given email. If hashed email is the same as user's id, returns user, if no user found in postsByUsers, returns null
 - getFeed(user: User): Set of posts for the given user, adds the posts of everyone which user follows to a set and returns the set.
 - search(keyword: String): a map from Users to String for every user in
 postsByUsers if their name contains the given keyword, puts the user with
 their name in a map and returns.
 - reverseMap(map: Map<K, V>): Map<V, Set<K>> based on the method signature complete this method.
 - All the methods In this class are static
